

Working to Protect City of Leavenworth Watersheds

WATERSHED RESTORATION TIPS

What is a watershed? It's a land area that channels rainfall and snowmelt to creeks, streams and rivers, and eventually to the reservoirs, bays and the ocean.

PLANT NATIVE TREES

On average, one tree produces 260 pounds of oxygen per year. Two trees produce enough oxygen for a family of four. That is helping 5,600 families breathe better.

EDUCATE AND ENGAGE

Encourage citizens to participate in local environmental training programs and events.

REDUCE STORMWATER POLLUTION

Install eco-smart projects that capture and treat stormwater runoff.
